Detailed Build Plan: Browser / Playwright MCP Server Integration

MCP Server: Playwright or Browser MCP (stdio)

Type: stdio

Priority: Medium (testing & scraping)

Purpose

Enable agents to automate browsers for UI testing, documentation scraping, and visual verification.

Integration Points

- Session Orchestrator → Option to attach browser MCP for testing sessions
- Tool exposure: `browser_navigate`, `browser_click`, `browser_screenshot`, `browser_evaluate`
- Diff viewer integration: Compare screenshots

Implementation

- Recommend `@modelcontextprotocol/server-playwright` or similar
- Add safety: Headless mode by default, limited permissions
- UI: “Enable Browser Automation” toggle per session

Security Considerations (Critical)

- High risk server (can control browser)
- Require explicit user approval
- Sandbox the Playwright process
- Limit to specific domains if possible

Testing

- Agent performs a simple UI test and returns screenshot + result

Dependencies: Playwright installed on host
