Detailed Build Plan: GitHub MCP Server Integration

MCP Server: GitHub (official or community http MCP)

Type: http

Priority: High

1. Purpose

Allow Grok Build agents to interact with GitHub (create issues, PRs, comment, manage repos) directly from within coding sessions.

2. Integration Points

- Config & Extensions Browser → “GitHub MCP” section with OAuth flow
- Session Orchestrator → Auto-attach if repo is GitHub-linked
- Event Bus → Emit events when PRs/issues are created via agent

3. Implementation Steps

Configuration

- Support OAuth (recommended) or Personal Access Token
- Store credentials securely via Grok’s built-in `~/.grok/mcp_credentials.json`
- Project-level linking: Detect `.git` remote and suggest GitHub MCP

Features to Expose

- Create PR from current branch + plan diff
- Comment on issues/PRs
- List open issues/PRs in repo
- Update issue status

UI/Backend

- “Connect GitHub” button → triggers browser OAuth
- Per-project GitHub repo mapping
- Quick actions in session view: “Create PR for this change”

4. Security

- Scope tokens minimally (repo scope only)
- Never store tokens in plain config — use Grok’s credential store

5. Testing

- End-to-end: Agent creates a test PR via MCP tool

Dependencies: OAuth handling (already in Grok Build)

Priority: High for developer workflows
